Project 1: Plan
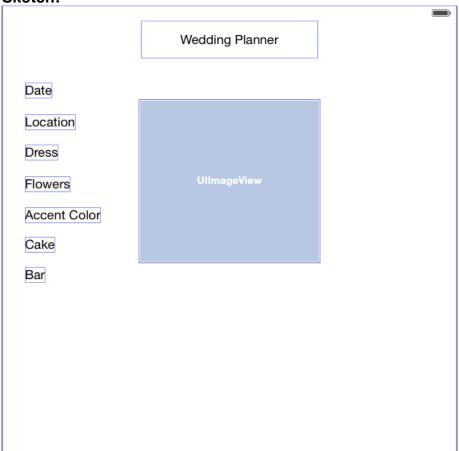

Description: Spending my free time working at a wedding venue has me planning my wedding out down to the little details. Of course this is YEARS in advance, but it never hurts to think about. Some or most people don't get to (or have to) spend all of their free time at a wedding venue and don't have the time to plan the little things. Let's suppose you've got less than a month to plan so you need decisions to be made and fast. Enter the random wedding generator, a few button clicks later you'll have your flower arrangement, accent colors, dress, venue, etc.

I'm going to create an app that basically makes all of the big wedding day decisions for you.

Sketch:

App Flow:
The user is greeted with the screen above

  Each word is a button that when pressed generates a random image

    Each button is connected to a set of images, which are randomly selected from by using a randomized sender or a switch

      Each button will have it's own switch set with cases for each image

The buttons will be clickable at any point, so you don't necessarily have to go in order; for instance you can start with cake if you'd like.

The images will all appear in the same space laid out above and replace one another when the next button is clicked.
